

Abbas Aziz

PLATFORM / DEVOPS ENGINEER

Kubernetes • Terraform • AWS • Docker • CI/CD • Observability • Python • SRE

Remote / International Teams • [Email](#) • [LinkedIn](#) • [GitHub](#) • [Engineering Portfolio](#)

PROFESSIONAL SUMMARY

Platform / DevOps Engineer with 5+ years across software development, cloud delivery, technical systems and remote engineering for US, UK and Singapore teams. Progressed from full-stack/backend development into containers, CI/CD, cloud infrastructure, production troubleshooting and reliability engineering. Hands-on with Kubernetes, Docker, AWS, Terraform, Linux, Python, PostgreSQL, Prometheus, Grafana, OpenTelemetry and Jaeger; current engineering work emphasizes autoscaling, SLOs/error budgets, alerting, distributed tracing and failure testing. Interested in Platform Engineering, SRE, Cloud/Infrastructure and AI infrastructure roles where reliability, automation and developer velocity matter.

CORE TECHNICAL SKILLS

Platform / Cloud: Kubernetes, Docker, Helm, AWS (EC2, ECS, CodeBuild, CodePipeline), Terraform, Linux, cloud infrastructure, container orchestration

SRE / Observability: Prometheus, Grafana, OpenTelemetry, Jaeger, Alertmanager, PromQL, SLIs/SLOs, error budgets, readiness/liveness probes, incident troubleshooting

Delivery / Automation: CI/CD, GitHub Actions, Git, deployment automation, rolling / blue-green / canary patterns, Infrastructure as Code, GitOps concepts

Software / Data: Python, FastAPI, Flask, Django, REST APIs, PostgreSQL, MongoDB, JavaScript/TypeScript, Bash/shell scripting

DevSecOps / Systems: IAM and least-privilege concepts, secrets-management concepts, RBAC, container/security fundamentals, networking, ingress, service discovery, load balancing

AI Infrastructure Readiness: AI/ML workload deployment concepts, inference/model-serving fundamentals, agent/LLM application observability, OpenTelemetry tracing, reliability and scaling patterns

PROFESSIONAL EXPERIENCE

Platform & Operations Engineer | Deen Removals and Storage | Aug 2024 – Sep 2026

London, United Kingdom | Remote

- Owned internal application and infrastructure systems across backend services, deployment workflows, databases, automation and production troubleshooting.
- Built and maintained a Python/Flask CRM that centralized lead, quoting and operational workflows into a single production system.
- Improved reliability by reducing manual processes, standardizing workflows and troubleshooting failures across integrations, databases and application services.
- Supported cloud-hosted services and more repeatable CI/CD and deployment practices while working directly with the founder as technical owner.
- Supported systems used during growth from roughly 2–3 to 20–25+ monthly conversions.

Software & DevOps Engineer | Works | Aug 2023 – Aug 2024

Singapore | Contract | Remote

- Supported application delivery across frontend, backend, databases and deployment workflows for an internal recruitment platform.
- Worked with engineering teams on releases, production issues and system dependencies in a distributed startup environment.
- Improved delivery reliability by identifying bottlenecks across application, database and deployment layers.
- Supported cloud-based application environments, Git workflows and CI/CD while troubleshooting production-facing issues.

Full Stack Engineer - Cloud & DevOps | Spec Digital | Nov 2022 – Dec 2023

Greater London, United Kingdom | Remote

- Built and maintained web applications across backend, frontend, databases and cloud-hosted environments.
- Took increasing ownership of Docker-based environments, deployments, release workflows and CI/CD alongside application development.
- Troubleshot performance and reliability issues across code, APIs, databases and hosting infrastructure.
- Worked with Python, cloud services and containerized applications to improve repeatability between development and production.

Junior Software Engineer | Spec Digital | Feb 2021 – Nov 2022

Greater London, United Kingdom | Remote

- Developed backend services using Python, Django and Flask with REST APIs and SQL/NoSQL databases.
- Used Docker, Git and AWS services including EC2, ECS, CodeBuild and CodePipeline for development, deployment and CI/CD workflows.
- Investigated application and hosting performance issues, contributing to a measured 14% improvement in loading performance.
- Built practical foundations in Linux, containers, cloud infrastructure, databases and automated software delivery.

Junior Full Stack Engineer | Psilocybin Alpha | Sep 2019 – Jan 2021

New York, United States | Contract | Remote

- Built and maintained application functionality using Django, Flask, React, JavaScript and REST APIs.
- Worked with PostgreSQL and MongoDB across backend application workflows and data models.
- Used Docker, Git, AWS and Azure environments as part of development and deployment processes.
- Debugged issues across frontend, backend, database and hosting layers with a distributed remote team.

Web Development Intern | Psilocybin Alpha | Jul 2019 – Sep 2019

United States | Remote

- Supported production web-property maintenance and frontend development using HTML/CSS, debugging and Git-based workflows.
- Gained early exposure to software deployment, production maintenance and distributed engineering practices.

SELECTED INFRASTRUCTURE & SRE PROJECTS

Kubernetes Autoscaling & Resource Governance | [Case Study](#)

- Built a 3-node Kind cluster; configured CPU/memory requests and limits, Metrics Server and HPA targeting 50% CPU. Under generated CPU load, observed FastAPI replicas scale from 2 to 4 in ~60 seconds and correlated scaling behavior in Prometheus/Grafana.

Stack: Kubernetes, HPA, Docker, FastAPI, Prometheus, Grafana, resource governance, load testing

Kubernetes Observability & Service Discovery Debugging | [Case Study](#)

- Deployed FastAPI/PostgreSQL with Prometheus Operator and Grafana; traced a 0/0-target monitoring failure to Service label and named-port mismatches, implemented ServiceMonitor discovery and restored 2/2 healthy Prometheus targets.

Stack: Kubernetes, Prometheus Operator, ServiceMonitor, Grafana, Helm, PostgreSQL, service discovery, RCA

SLO-Based Alerting & Incident Simulation | [Case Study](#)

- Defined a 99% availability SLO, recording rules and error-budget burn alerts; injected a PostgreSQL dependency outage under sustained traffic, observed ~45-second detection and validated alert firing, recovery and auto-resolution.

Stack: SRE, SLIs/SLOs, error budgets, PromQL, Alertmanager, incident simulation, readiness probes

High-Availability API & SLO Observability | [Case Study](#)

- Instrumented a FastAPI/PostgreSQL workload for user-facing reliability signals, dependency-aware health checks and failure analysis; demonstrated that low latency can coexist with failed requests and used SLO-based monitoring to expose the real service impact.

Stack: Kubernetes, FastAPI, PostgreSQL, Prometheus, Grafana, availability, readiness/liveness, observability

ADDITIONAL ENGINEERING WORK

- Distributed tracing: instrumented FastAPI with OpenTelemetry and validated service operations, spans and parent/child trace relationships in Jaeger for request-level debugging.
- Deployment/reliability lab work includes Kubernetes Deployments/Services/Ingress, Helm, readiness/liveness probes, rolling/blue-green/canary patterns, Alertmanager and failure/recovery testing.
- Current direction: Terraform-based Infrastructure as Code, CI/CD/GitOps, cloud deployment and production-style AI infrastructure patterns including model/inference serving, agent/LLM observability and workload reliability.

EDUCATION & CREDENTIALS

Bachelor's Degree - Electrical Engineering (Power Systems) | University of Engineering & Technology | Sep 2017 – Sep 2021

Full Stack Web Developer Nanodegree | Udacity | Oct 2022 – Mar 2023

EF SET English Certificate - C2 Proficient (74/100) | Feb 2026

ADDITIONAL

Languages: English - Native/Bilingual proficiency; German - Elementary proficiency. **Work style:** Remote-first, asynchronous collaboration; experience with US, UK and Singapore teams.
